AT4103 LNMS

✓ POLYESTER RESERVOIR

A lightweight but sturdy design, with integrated slosh baffles and laminated piping. The reservoir is fitted slightly off-centre for optimum weight distribution and integration of the suction arm. The level of the reservoir can be read on the pilot screen.

SUCTION ARM

An 8" suction arm is fitted by default next to the driving cab, with a reach of 160 degrees. The suction arm can be **operated easily with the joystick** and can load between 2.75 metres deep and 4.5 metres high. When the valve is closed, the suction arm is sucked empty.

Option: 'Superload' – a centrifugal pump with bypass – with 8" or 10" suction pipe. The design of the suction arm allows the operator to maintain **excellent view**, also in the transport position.

Heavy-duty three-point linkage with CAT3 dimensions and CAT4 link pins. Walterscheid toplink, link arms and link ends with stabiliser function. There is also an integrated trailer hitch.

The linkage can be used lifting, pushing, floating and rigidly. A control console allows operation of the linkage on either side of the machine.

The activation moment of the distributor, the pump and the coulter valves can be set on the pilot screen, depending on the linkage height.

✓ PUMP AND CUTTER

The Borger pump is fitted at an angle of 45 degrees to minimise the number of bends in the piping. The piping between the pump and the cutter is 10". The Borger pump has a capacity of 6 m³ per minute. The pump capacity can optionally be extended to 9 m³ per minute. Loading and unloading are done with one press of a button. The pump speed can be adjusted manually during loading.

The Vogelsang RotaCut cutter has a large collector for stones. The cutter has a large door for maintenance and inspection. By default the piping has hydraulically operated knife gate valves.

√ OP

OPERATION

The reservoir can be loaded or unloaded with one press of a button. The machine adjusts itself, according to **the previously loaded fertilisers**. While working in the field, the operator can operate all functions using the switches and buttons on the well-organised dashboard.

The AT4103 DNMS has a **Tebbe spreader** superstructure with a wide bin (internal width 2.56 metres). The wear-resistant bin and wear parts are made from Hardox steel. The metering valve height can be adjusted hydraulically. The compost is transported by the Rübig bottom conveyor belt to the two horizontal beaters and two metering discs with a diameter of 1.20 metres. The speed of the separately driven beaters and metering discs can be regulated from 300 to 800 rpm.

The speeds of the beaters and the metering discs can optionally be regulated independently by means of a direct hydraulic drive. The metering quantity can be controlled from 2 tonne/hectare and a spreading width up to a maximum 18 metres.

The spreader superstructure is equipped by default with a weighing system. The weighing system has four weighing units, ensuring continual feedback of the current dose based on the weighing system. The operator can manually correct the dose per hectare during spreading.

- Compost spreader
- Large capacity Tebbe spreader superstructure
- Five drive and steering wheels
- Mechanically driven tandem
- Engine capacity up to maximum 550 hp

· Vinasse and other liquid fertiliser

• Dosage between 500 and 10,000 litres per hectare
